**News: Aastra Telecom Earns tekVizion Labs' VoIP Interoperability Certification with Sylantró's Hosted Communications Platform**

*Aastra's 480i SIP Phone certified with Sylantró's Applications Feature Server*

Aastra Telecom today announced that tekVizion Labs™ has issued interoperable certification to Aastra Telecom for deployment with Sylantró Systems' telco-grade Applications Feature Server.

tekVizion Labs has certified Aastra Telecom's 480i SIP Phone as interoperable with Sylantró Systems Corporation's Applications Feature Server, which is the foundation for many Tier-1 service providers' hosted Voice over IP (VoIP) service offerings worldwide.

Sylantró was one of the inaugural "Premier Tenants" of tekVizion Labs and has authorized tekVizion to conduct certification testing and/or remote interoperability testing for third-party technologies such as Aastra Telecom. In order to be certified, Aastra's 480i SIP Phone had to pass Sylantró's mandatory test suite in a converged network, including verifications such as SIP torture testing, verifying redundancy operations and security features, as well as call feature interoperability.

Aastra plans to announce shortly the certification of three additional IP phones in the line – 480i CT, 9112i, and 9133i – as they are currently undergoing testing by Sylantró.

**Timing:** Effective immediately
